

Chronograph

BY ZATONA METROLOGY

We are building Chronograph now, starting with FDA MAUDE. Everything below describes the service as it will work at launch: capabilities, plans, prices and terms. It is not yet available for use or purchase. FDA has announced that MAUDE data will become available in its Adverse Event Monitoring System (AEMS) in 2026. Join early access at chronograph.dev.

What the record said on the date that matters, and what changed after

For a date on or after our first capture of a record, retrieve the latest version we successfully captured on or before that date, and compare it with later captured versions. Base your numbers on fixed captured records, and show exactly which versions they came from.

Fixed records do not move when the source updates. Current source records alone do not provide a complete history of what was published when. FDA updates MAUDE monthly and publishes changes to existing reports in separate Change files. NHTSA publishes a single file of all complaints, listed as daily. CPSC must remove or correct information in a report it finds materially inaccurate. The CFPB provides an archive of complaint narratives previously published for complaints received through August 14, 2026.

Chronograph preserves the versions we successfully capture, starting with our first capture of each record.

What you get

01 The latest version we successfully captured on or before your chosen date , from our first capture of that record onward, alongside another captured version (the record as it stood).	02 Every change and removal we recorded , with the date we saw it (the edit log).
03 Records you can hand to the other side or your own expert , exactly as the source sent them, with a receipt for each one that anyone can check without us (a Record Package).	04 An alert when a record you watch changes.
05 A dated copy of a public web page , such as a recall notice, a label or a company statement, captured on request.	

An example from FDA files we downloaded before launch

This is not Chronograph output, and not a list of file versions the product will hold at launch. On September 29, 2026, while Chronograph was still being built, we downloaded earlier FDA public data files with a temporary script and later compared them with FDA's October 2026 change files.

Report 1038671-2023-00174 is an Exactech knee injury report. In FDA's earlier device2023.zip file, whose server Last-Modified date was December 29, 2025, its Brand Name field reads

“LOGIC FEMORAL PS CEM LEFT SZ 3.5”. In FDA’s October 2026 change files, the same field reads “LOGIC TIBIA PS MOD INSRT SZ 3.5 11MM”. The model number field reads “LOGIC FEMORAL PS CEM LEFT SZ 3.5” in both versions. This comparison does not resolve which device was involved.

It is one of 60 Exactech injury reports under knee product code JWH, first received by FDA in 2022 through 2024, that list a supplement FDA received in September 2026. The product problem flag changed from N to Y in 42 of the 49 with an earlier N (86%). Among reports from other manufacturers with the same receipt years, a September 2026 supplement and an earlier N, it changed in 7 of 466 (1.5%), across all product codes.

What this does not show: which supplement changed a field, or why. After a follow-up report, MAUDE displays the most recent report information. Under 21 CFR 803.56, a manufacturer that obtains required information omitted from its initial report because it was then unknown or unavailable must submit it within 30 calendar days of receiving that information. These file dates do not show when the manufacturer obtained information. This is a comparison of public FDA data files; it draws no conclusions about why a value changed, about the events or about any party.

What a record says, and what it doesn’t

■ Our history starts on the date of our first captures. We cannot show what a source looked like before we began recording it.	■ We see changes between our captures. If a source changed something and changed it back in between, we cannot see it.
■ A record shows what a public source showed when we captured it, not that the source was right. We confirm the capture, not the content.	■ We do not promise admissibility in court, and nothing here is legal advice.

How clients use it

01 Preparing a case	Choose a date on or after our first capture of the record. Open the latest version we successfully captured on or before that date and compare it with a later captured version. The edit log shows the changes and removals we detected, and when we saw them. To share the records with the other side or your own expert, order a Record Package. Each record comes with a receipt anyone can check without us: no account, no call to us. PRODUCTS Pro or Firm, Record Package, Revision History Report.
02 Working as an expert	Numbers pulled from a live database shift with every update at the source. Work from the history of the records in your area as of a fixed date, and the dataset behind your report stays the same next year. Keep each project in its own workspace and export tables laid out for reports. When the facts of a capture need a signature, order a Capture Declaration: a written statement of what we captured, when and from where. It confirms the capture, not what the source said, and includes no testimony.

How clients use it (continued)

	To lock the set of records behind your work, fix it as a Fixed Study: the records you chose, each at its exact version as of your date, with what that version rests on, your selection criteria, and what you included or excluded and why. Once fixed, the study never changes and gets a final receipt; order it as one Record Package to hand it on. No subscription needed. PRODUCTS Expert, Fixed Study, Capture Declaration.
03 Watching your area	Put a watch on the records you follow, and get an alert when one changes. Looking back rather than ahead? A Public Reporting Timeline shows what public sources showed about a subject by a date you set. PRODUCTS Pro, Expert or Firm, Extra Watches, Public Reporting Timeline.
04 Capturing a page for a dispute	Recall notices, labels, instructions for use, company statements: web pages change without notice. Capture public pages anyone can open without logging in, on request, and get a receipt anyone can check without us. We don't get around access limits, bot protection or CAPTCHAs. A capture drawn in our browser records the conditions it was made under (browser, language, time zone, screen size, network location) and shows one state of the page under them. The time zone is UTC and the language US English unless you set your own time zone and language for an order or a schedule. A capture made without the browser, such as pages found while crawling without screenshots, keeps the site's response to our request and the request we sent, without running the page's scripts. Either way, versions a site shows to other locations, to A/B test groups or to logged-in visitors are not covered. Every address in a job gets a result, including addresses the job stopped before reaching, and a scheduled capture that did not run is recorded with the reason. Captures you order are private by default. Federal public-source captures ordered under Matter Capture follow Section 11.8 of the Terms: their content joins the public archive after 90 days, unless a signed agreement provides a longer delay. Other ordered captures stay out of the public archive, search, Model-read, marketing and aggregate analytics unless you enable that use. We never use ordered captures to train models. Capture again, or on a schedule, and you see what changed between one successful capture and the next. Each capture set is kept for 90 days. Extend storage or download the set before then. After day 90 the set is frozen for 30 days: the files stay, but you can't open or download them until you extend storage, which restores access right away. On day 120 the files are deleted; the capture record and receipts remain. Exports for eDiscovery review come with Expert, Firm and Matter Capture, or as a separate purchase. Without a subscription you get the capture, its download and its receipt. PRODUCTS Capture Packs, Extended Storage, Assisted Capture Request.
05 For larger matters	If a dispute is coming, start recording before it arrives. With Matter Capture, we capture the sources you need from the day you sign, for at least six months. Organizations that need the history inside their own systems take Enterprise: records as of any date, and what changed between versions, delivered by agreement. PRODUCTS Matter Capture, Enterprise, Version History License. Model-read: coming after manual accuracy review.

Plans and prices

Prices exclude tax. Where we are required to collect sales tax, it is added at checkout based on your billing address, and you see it before you pay. Some products open later; they are labelled in the list.

Records plans

Plan	What you get	Price
Public	No account needed: open any record and its receipt, check the receipt in your browser or from the command line, and search current versions up to 5 times a day. Record pages themselves have no limit.	Free
Free	A free account with 25 searches a day (up to 300 a month), saved searches and 3 alerts when the current version of a record changes. No history, version comparison or exports.	\$0
Pro	For one professional: how a record looked on any date since we started recording it, version comparison, the edit log, 25 watches, 50 exports a month and 3 trial page captures a month.	\$99 / month
Expert	Everything in Pro, plus separate workspaces, exports laid out for reports, 100 watches, 200 exports a month, 10 trial page captures a month and help with Capture Declarations (ordered separately).	\$349 / month
Firm	Everything in Pro for a team of three or more: shared workspaces and watches, admin, member and viewer roles, one invoice, and a shared pool of 50 watches, 100 exports and 5 trial page captures a month per seat.	\$249 per seat / month, from 3 seats
Courts	Free for courts: everything except model-read features. Apply with an official court email address; each request is reviewed by a person.	Free
Universities, press, NGOs	Public access, or a written grant for a specific project, for universities, the press and nonprofits. Each request is reviewed by a person; grants run for 12 months.	By application

Model-read plans

Plan	What you get	Price
Pro+ AFTER MANUAL ACCURACY REVIEW	Pro, plus model-read labels for the type of failure as of a date, search by meaning and across versions, flags on substantive edits and one model run a month. Unused runs do not roll over.	\$229 / month
Expert+ AFTER MANUAL ACCURACY REVIEW	Expert with everything in Pro+ and three model runs a month.	\$549 / month
Firm+ AFTER MANUAL ACCURACY REVIEW	Firm with everything in Pro+ and two model runs per seat a month, pooled across the team.	\$399 per seat / month

Add to any plan

Product	What you get	Price
Model-read Run AFTER MANUAL ACCURACY REVIEW	One model run on any paid plan: you set the criteria and the date, and get a file with the labels, where each one came from, the date, the exact model version and a receipt.	\$149
Matter Pass AFTER MANUAL ACCURACY REVIEW	Model-read for one workspace for 30 days on a Records plan: up to 500 records and 20 model runs. Move the same workspace to Matter Capture+ within 30 days and the full price counts toward its first month.	from \$750 one-time
Extra Watches	25 more watches for 30 days from purchase. Paid once, no subscription. When the pack ends, the extra watches pause; nothing is deleted.	\$25
Extra Exports	50 more exports for 30 days from purchase. Paid once, no subscription. Exports you don't use expire with the pack.	\$25

For one project

Product	What you get	Price
Record Package	The captured bytes of one record or many, in one ZIP with one index for all records in the package and a receipt for each record, so anyone can check them without us. Over 500 records, ask us.	\$79 per record for the first 10, then \$39 per record
Fixed Study	A set of up to 500 records, counting the ones you exclude, fixed as of the date you choose: each record at its exact version, with what it rests on, your selection criteria and your include or exclude decisions. Once fixed, it never changes and gets a final receipt. No subscription needed. Within 90 days, the \$149 counts toward a Record Package for the same study. More than 500 records: by individual offer.	\$149
Capture Declaration	A written statement of the facts of a capture, signed electronically: what we captured, when, from where, and how to check the receipt. It confirms the capture, not what the page said, and includes no testimony.	from \$750
Revision History Report	Every recorded change to one item, version by version, from the first time we recorded it. A person checks each report before we deliver it. We quote first; pay by card or by invoice.	from \$1,500
Public Reporting Timeline	What public sources showed by date X, assembled from our records without the model.	from \$3,500
Public Reporting Timeline (model-read) AFTER MANUAL ACCURACY REVIEW	Similar public reports selected by criteria you set before the work starts, written into the order, read by the model and checked by a person, as they stood by date X.	from \$20,000 (narrow scope from \$9,500, complex from \$35,000)

Web page capture

Product	What you get	Price
Capture Pack 10	Ten complexity units for capturing public web pages, valid for 90 days, with or without a subscription.	\$249
Capture Pack 25	Twenty-five complexity units for capturing public web pages, valid for 90 days, with or without a subscription.	\$549
Capture Pack 100	One hundred complexity units for capturing public web pages, valid for 90 days, with or without a subscription.	\$1,690
Assisted Capture Request	For long lists: send us the addresses, and we capture each page and document the result. Complexity units are charged on top of the request fee; the fee is not refunded if a site blocks access or an address is wrong.	from \$250 per request, plus units
Extended Storage	Keeps a capture set past the 90 days included, paid per gigabyte per year with a yearly minimum per set.	\$120 per GB per year, minimum \$25 per year per set

The system sets the units, not you: 1 for a simple page, 3 for a heavy one (content that needs scripts to appear, very long pages, many files, several redirects or a large total size), 10 for video with subtitles, and 1 per address when crawling a site, with a minimum of 25 per crawl. You see the estimate first and approve a ceiling. If a capture would go over it, we stop or ask again. If our attempt gets the page and every file it asks for while loading, the capture uses its units. If some of those files don't arrive, it still uses them and is marked partial, with what is missing listed. If the page is still loading when our time limit runs out, but we saved the page and at least one rendered result (page code, visible text or screenshot), the capture uses its units within your ceiling and is marked partial, saying it timed out and what was saved; otherwise the units come back. If our attempt gets a block page, a CAPTCHA or a robots.txt rule against our crawler, or doesn't get the page itself in time, the units come back; saving those responses costs nothing. If our system fails during a capture, that

address uses no units, its share of your reserve is released, and any units already charged for it come back. The same applies if our browser fails on our side while drawing a page, even when the page and part of the drawing were saved; the result says why and lists what was saved. An address the job stopped before reaching uses no units, its share of your reserve is released, and it is listed as not attempted; a crawl with nothing charged has no 25-unit minimum. A page whose main document has the same bytes as your capture of it within the last 24 hours is free. A wrong address costs 1 unit. Without a subscription, a site crawl covers up to 50 addresses; more with our approval.

We capture only what anyone can open without logging in. We don't get around access limits, bot protection or CAPTCHAs. We refuse captures meant for tracking or harassing people or for copying other people's content in bulk.

By agreement

Product	What you get	Price
Matter Capture	From the day you sign, we capture the sources you need, for at least six months; sources, volume and frequency are set in the agreement. Includes up to 20 web addresses captured weekly: simple pages only, up to 100 complexity units a month, and unused units don't roll over. Screenshots cover addresses on your list only, one frame per page, so very long pages can be cut off. You get the changes we detect between successful captures.	from \$1,200 / month, 6-month minimum

By agreement (continued)

Product	What you get	Price
Matter Capture+ AFTER MANUAL ACCURACY REVIEW	Matter Capture plus model labels and flags on substantive edits across the captured set, with a monthly summary. At least six months.	from \$2,400 / month
Substantive Edit Watch AFTER MANUAL ACCURACY REVIEW	The model flags substantive edits in an area you choose, such as a product code family or a manufacturer, and sends a weekly summary. At least three months.	from \$990 / month
Enterprise	How records looked on any date, and what changed between versions, delivered into your own systems for an agreed set of sources and volume.	from \$2,000 / month
Enterprise+ AFTER MANUAL ACCURACY REVIEW	Enterprise plus model-read fields with where each label came from and a feed of substantive edits.	from \$5,000 / month
Version History License NOT AVAILABLE YET	A license to the version history of one source family for use in your own systems, with no redistribution. Available once the family has 12 months of unbroken history; data arrives with a 24-hour delay unless agreed otherwise.	from \$3,000 / month per source family
Version History License (whole catalog) NOT AVAILABLE YET	The same license for every source family we record, billed annually.	from \$15,000 / month, annual only

How page captures work in Matter Capture: each page on your list that our browser could load gets one screenshot, taken by our browser from the page as it was displayed during that capture. A very long page may be cut off in that screenshot, and the capture record says by how many pixels; the page code and the files our browser received, including the part below the cut, stay in the saved web archive file. Pages we find by

crawling are saved as web archive files without screenshots until you add their addresses to your list. PDFs are made only when you ask for a package or an export, not during scheduled captures.

You hear about changes we detect between successful captures. This is not continuous monitoring, and it does not mean nothing changed between captures.

Measurement series, by agreement

Product	What you get	Price
As-Computed Series	Measurement series exactly as they were computed at the time, fixed at the moment of calculation and never recalculated. For non-financial organizations only.	from \$2,000 / month

Measurement series, by agreement (continued)

Product	What you get	Price
Exclusive Measurement Series	By written agreement: we supply one defined measurement series only to your organization and recipients named in its license for the agreed term. We do not supply that series to other buyers or grant recipients, directly or through broader products or intermediaries. We offer exclusivity only where existing commitments permit it. Exclusivity does not change the measurement or restrict access to the archive, public source records or independent research, and does not prevent disclosure required by law or a court. Unavailable to financial buyers or financial end recipients, including through intermediaries.	from \$150,000 for 12 months

Each value is a research measurement: not evidence, not legal advice and not an expert opinion.

Optional workflow help

Choose one-time setup or optional monthly guidance. Neither requires purchasing the other.

Workflow services

Product	What you get	Price
Personal Workflow Setup	Set up one agreed Chronograph workflow: available public sources, records and dates, workspace and watches within your plan, dated versions, comparisons and standard exports. Learn to repeat it yourself. Up to 3 hours total, including preparation, correspondence, setup, training and meetings. Subscription sold separately.	\$1,500 one-time
Monthly Workflow Guidance	Optional help when your Chronograph workflow needs new sources, records, dates or settings each month: update the agreed setup, work through dated versions and comparisons, and repeat standard exports yourself. Up to 4 hours a month, including preparation, correspondence, setup, training and meetings. Subscription sold separately.	\$1,500 / month
Additional Workflow Hours	Additional work on your agreed workflow beyond the included time. Preparation, correspondence, setup, training, meetings and written handoff all count. You approve the scope and a spending limit in writing before we start.	\$350 / hour

All work on the agreed workflow counts toward the included time or approved additional hours, not just calls: preparation, correspondence, setup, training, meetings and written handoff. Agree on the scope and check your actual plan rights before purchase; no extra work starts without written approval of its scope and spending limit.

We use only available public sources, recorded history and the features your plan supports, within its limits. We cannot show a source before our first capture or changes made and reversed between captures. For page captures, we use pages anyone can open without logging in; we do not get around access limits, bot protection or CAPTCHAs. These services do not unlock unavailable features, Model-read or continuous monitoring.

The workflow service is a separate paid item, not a plan upgrade or a finished research deliverable. Subscription, extra watches or exports, paid page-capture units and extended storage are separate purchases. Record Packages, Fixed Studies, Capture Declarations, Revision History Reports, Public Reporting Timelines and other research are

separate orders; custom software, connectors and integrations need a separate scope and quote. Work already included in a Matter Capture or Enterprise agreement stays included. We do not charge again for the same work or result.

Service-specific terms are agreed in writing before purchase. The plan terms below do not automatically apply to workflow services. No new response-time commitment or personal access to the founder is promised.

You can use Chronograph yourself. Documentation, ordinary product help and bug fixes are included and do not use personal-service hours. Your plan or contract's support scope and response commitments stay unchanged. Optional individual help covers an agreed workflow setup and training: the available sources, dates and watches your plan supports, and practice with the steps your team will repeat. You pay for that agreed work, not for ordinary product help or bug fixes.

Terms for everyone

■ Prices exclude tax. Where we are required to collect sales tax, it is added at checkout based on your billing address, and you see it before you pay.	■ Paid plans renew automatically, every month or every year depending on how you pay, until you cancel. Cancel in one click any time before the renewal date; your plan runs until the end of the period you've paid for. Plans with a minimum term are billed through that term. One-time packs and purchases never renew. Signed agreements follow their own terms.
■ Need more than your plan includes? Buy one-time packs of watches or exports. We never charge per query.	■ Pay yearly and get one month free. Two months free with 10 or more seats, or with three active Matter Capture, Matter Capture+ or Matter Pass agreements.
■ No founder pricing. Prices can change at renewal, and we tell you in writing first: 30 days before the change on monthly plans, and 30 days before renewal on yearly plans.	■ Prices do not depend on which side of a dispute you represent. Records products remain available on the same terms; a measurement series covered by an active exclusive agreement is unavailable to other buyers for that agreement's scope and term.
■ Courts use Chronograph free. Universities, the press and nonprofits can apply for a grant for a specific project.	■ Checking a receipt is always free, with or without an account; this means integrity checking only, not free display, hosting or bulk checking.
■ Trial captures in plans cover simple pages only and don't roll over. To get a declaration, an eDiscovery export or longer storage, convert them to paid units within 7 days.	■ Larger work is quoted in writing; "from" marks where a quote starts.

■ Financial buyers may purchase Standard Archive features: already released public-source records, historical versions, literal comparisons, edit logs, standard exports, ordinary workspaces, Record Packages, alerts when we detect a change in a record matching filters you choose, and Records API access to the same archive content. Available alert delivery options and notification contents depend on your plan and delivery channel. Financial status does not change the delivery rules for eligible archive content, including immediate delivery where available.	■ Financial buyers may use that content in their own investment research. We provide no investment recommendations, ticker mapping, prioritization based on your holdings, investment-significance assessments or exclusive or preferential first delivery.
■ Financial eligibility excludes computed measurements, Model-read and "+" features, measurement series, exclusives and options, Version History License and catalog licenses, Enterprise agreements, Fixed Study, trial or ordered captures, commissioned research, reports and declarations, and paid workflow services, including through intermediaries or within plan bundles. We show the eligible features before payment.	■ Other buyers of restricted products must confirm in writing that those products and their results will not be used or supplied for investing, trading or hedging. Permitted Standard Archive purchases do not require that confirmation.
